

Investment thesis 1: AI is a hardware boom, and Asia owns the chokepoints

Taiwan, Korea and Japan each control a bottleneck

Taiwan: makes the chips

- HPC/AI 58% of TSMC revenue (2025); 3nm sold out through 2026
- TAIIEX record 48,476 (2 Oct 2026), ~+67% YTD; TSMC >40% of the index

~70%

TSMC share of global foundry revenue (Q1 2026)

Korea: makes the memory

- DRAM contract prices +45–50% q/q in Q2 2026; server DRAM still undersupplied
- KOSPI forward P/E 7.8× vs 23× trailing: earnings, not just multiples

83%

SK hynix (50%) + Samsung (33%) share of HBM revenue (Q2 2026)

Japan: makes the tools

- Test equipment +31% and DRAM equipment +39% in 2026 (SEMI)
- Advantest + Tokyo Electron ≈ 20% of the Nikkei 225; forward P/E 17.2×

~55%

Advantest share of chip test equipment

Demand is surging, but the cycle is maturing

Chip market, US\$bn (WSTS)

Hyperscaler capex, US\$bn

DRAM contract price, q/q

Cycle check

- Memory prices still rising, but gains slowing (midpoints of TrendForce ranges)
- US 25% tariff on some advanced chips since Jan 2026 (Section 232)
- **Structural demand, cyclical prices: own it through a structure built for volatility (thesis 2)**

Sources: Counterpoint (foundry, HBM); TSMC; Trading Economics / TWSE; TrendForce (DRAM, range midpoints); Sibilis (P/E, 1 Jul 2026); SEMI (14 Jul 2026); WSTS (2025 actual \$795.6bn; 2024 implied; 2026–27 Spring 2026 forecast); company reports and guidance midpoints (capex; Microsoft 2025 calendar-year estimate); White House Proclamation 11002.

Whichever AI model or company wins, it needs Taiwan's chips, Korea's memory and Japan's tools.

J.P. Morgan's 2026 Outlook: the AI moat is real, and so are its cracks

"Smothering Heights: is the largest moat in market history indestructible?" (M. Cembalest, J.P. Morgan Asset & Wealth Management, 1 Jan 2026)

The theme is the market

\$3trn → \$18trn	Market cap of 4 hyperscalers + NVIDIA, TSMC, ASML, AMD in ~7 years: ~20% of MSCI World
65–75%	Share of S&P 500 returns, profits and capex since Nov 2022 from 42 AI-linked stocks
8 of 10	Of the world's 10 largest companies depend heavily on TSMC supply

...but the moat has cracks

10–11 days	Taiwan's gas storage; LNG is 40% of its power and 90% of energy is imported: "the most blockade-sensitive advanced economy"
\$1.3trn	Hyperscaler capex + R&D since 2022: risk of a "Metaverse moment" (Mag 7 fell 50% in 2022)
–10–15%	JPM's base case: a correction at some point in 2026, then markets end the year higher

Source: J.P. Morgan Asset & Wealth Management, Eye on the Market, 2026 Outlook "Smothering Heights" (M. Cembalest, 1 Jan 2026), pp. 1–2, 7, 33–35, 46; underlying data Bloomberg, USITC, BP, ROC Taiwan, Global Guardian. Reliance values read from JPM's chart (approximate).

J.P. Morgan's key risks (concentration, Taiwan, a 10–15% correction) are what an autocall with a 30% buffer and a 70% floor is built to absorb.

Investment thesis 2: Volatile markets and high rates favour autocallables

Economic aspect: a strong theme on a volatile path

Structural growth, but a violent, concentrated and late-cycle equity market

Growth is structural...
Capex +77% and chip market +90% in 2026 (thesis 1).
...but the path is violent
Down 10–25% in 2022, then 2–3× since. KOSPI fell 8.95% in a single day (13 Jul 2026).

Finance aspect: today's rates and volatility suit autocalls

Rates are high and rising again; volatility is at records

The Fed is hiking again
16 Sep 2026: +0.25% to 3.75–4.00%, the first hike since 2023; median dot 4.1% for end-2026.
Markets price more
~87% probability of at least one further move priced by futures.

- 1

-25%

Round trips happen fast: KOSPI went from 9,000+ in June to 6,789 on 28 Aug; J.P. Morgan expects a 10–15% correction in 2026.
→ **Autocall coupons are paid when the basket gets back to its start: no need to time the bottom**
- 2

>40%

Returns hinge on a few names: TSMC >40% of TAIEX; Samsung + SK hynix ~48% of KOSPI; ~92% of advanced chips from Taiwan.
→ **Use a diversified ETF basket, not a worst-of on single names**
- 3

38.6×

Valuations price in a lot: Nikkei CAPE 38.6×; Taiwan among the most expensive markets; DRAM price gains slowing.
→ **Capping upside at the coupon costs little when the good news is already priced**

- 1

-4.0%

Long bonds carry rate risk: A 5-year bond loses ~4.0% per 1% rate rise, as the Fed hikes again.
→ **Autocalls can redeem from year 1: short duration, and cash to reinvest at higher rates**
- 2

91.2

Volatility is at records: VKOSPI closed at an all-time high of 91.2 (9 Jun 2026), above the 2008 peak.
→ **Rich option premium funds higher autocall coupons**
- 3

75.8%

High rates make guarantees cheap: At 5.69% 5Y USD funding, USD 100 payable in 5 years costs only USD 75.8 today.
→ **A capital floor is affordable inside an autocall**

Sources: TWSE, KRX/press, Nikkei (index levels; 2021–23 KOSPI/Nikkei to verify); Asiae, FN News, BIT Research (KOSPI); J.P. Morgan 2026 Outlook; Trading Economics, Sibilis (valuations); TrendForce; Federal Reserve via Advisor Perspectives; Herald / SBS (VKOSPI); case funding grid; standard bond maths.

Investment thesis 2: Traditional strategies fall short; autocallables fit 2026

	Market reality in 2026 (evidence)	Plain bonds / buy-and-hold	Autocallable answer
Rates The Fed sees rates high until 2028	FOMC dot plot, 16 Sep 2026 (shaded: today's 3.75–4.00%) 5Y bond value vs rate move (%)	A 5-year bond loses ~4.0% for every 1% rise in rates, and 12 Fed dots sit at 4.375% for 2026–27: more hikes are possible.	Early exit: can redeem from year 1, so duration is short. Cheap floor: USD 75.8 today buys USD 100 in 5 years, so a 70% floor fits inside.
Volatility Violent paths, record fear gauges	TAIEX, KOSPI, Nikkei 225 (end-2021 = 100)	Index levels fell 10–25% in 2022, then rose 2–3×; KOSPI lost ~25% from June to August 2026. Buy-and-hold must sit through it or time the bottom.	Paid on recovery: coupons pay once the basket is back at its start; memory catches up missed ones. Vol funds the coupon: VKOSPI hit a record 91.2.
Valuation Much good news is priced, in a few names	Price/earnings, 1 Jul 2026 (Siblis Research)	KOSPI trades at 23× trailing earnings; Nikkei CAPE 38.6×; TSMC is >40% of TAIEX and Taiwan makes ~92% of advanced chips. Upside is concentrated and partly priced.	Diversify: five-ETF basket, not a worst-of on single names. Cap costs little: giving up upside beyond the coupon matters less when it is already priced.

Market proof: Taiwan structured-note issuance rose 81% in 2025, with autocalls the favourite payoff (SRP). Investors facing the same market are already choosing this answer.
