

Strategy: five Asian AI-hardware ETFs, combined to cut risk

USD 100mn across five Bloomberg-listed ETFs; mixing them gives most of the return with less volatility than the riskiest funds

Allocation

Half in the semiconductor core
3119 HK + 2644 JP = 50%; Korea adds memory, Taiwan the foundry, 00878 the ESG income.

■	3119 HK	Pan-Asian chip leaders	35%
■	EWY US	Korea: memory for AI	20%
■	EWT US	Taiwan: the AI foundry	15%
■	2644 JP	Japan: chip-making tools	15%
■	00878 TT	ESG dividend anchor	15%

Risk vs return: single ETFs and random mixes

How to read it

Orange dots: each ETF on its own (2644 is the dot near 0.26, 0.25).
Small dots: thousands of random weightings of the five ETFs; lighter = more return per unit of risk.
Axes: annualised volatility (risk) and expected return.

Takeaways

- Mixing cuts risk: most mixes sit at 22–32% volatility, far below EWY (~49%), while still returning 25–28%.
- 3119 HK has the best risk/return on its own, so it gets the largest weight (35%).
- EWY is the riskiest for its return, so it is held for memory exposure at 20%, not more.
- EWT has the highest return (~31%) and 2644 one of the lowest volatilities (~26%): 15% each rounds out the chain.

One theme, five bottlenecks: weighted towards the best risk/return (3119 HK), diversified to keep volatility down

Risk/return chart: team analysis app (annualised from historical data; red star as marked in the app). Liquidity: 3119 HK is borderline against the USD 5M/day rule, verify on Bloomberg.

Monte Carlo: the median portfolio grows 2.8× in five years

5-year simulation of the five-ETF portfolio, per USD 100,000 invested (×1,000 for the USD 100mn mandate)

\$279.6k

Median at Year 5: 2.8× the start, +22.8% a year

\$103.6k

Bearish (5th percentile): still above the start, +0.7% a year

\$770.5k

Bullish (95th percentile): 7.7× the start

99.0%

Chance of ending at or above the USD 70,000 target

Even the bearish path ends above the start (\$103.6k); the USD 70,000 target is the 1st percentile

Source: team Monte Carlo app (annual checkpoints of the simulated paths). Lines connect the yearly values. Results depend on the app's return and volatility inputs; refresh with Bloomberg data at the 17 Sep 2026 trade date.

Annual checkpoints: the downside stays above the USD 70,000 target

Simulated portfolio value at each year-end, per USD 100,000 invested

Timeline	Median value (USD)	Bearish 5th percentile (USD)	Bullish 95th percentile (USD)	Probability ≥ target (USD 70,000)
Start	\$100,000.00	\$100,000.00	\$100,000.00	—
Year 1	\$122,798.06	\$77,939.19	\$189,886.46	97.72%
Year 2	\$150,858.02	\$79,780.84	\$286,013.81	97.46%
Year 3	\$186,215.83	\$83,307.87	\$406,264.32	97.76%
Year 4	\$228,430.07	\$92,823.04	\$564,512.06	98.28%
Year 5	\$279,609.52	\$103,554.03	\$770,498.81	99.00%

Year 1 is the stress point

The 5th percentile falls to \$77.9k (−22%) before recovering every year after.

The target holds

At least 97.5% of paths stay at or above USD 70,000 in every year, rising to 99.0% at Year 5.

Upside compounds

Median \$279.6k at Year 5 (+22.8% a year); for the mandate, about USD 280mn.

A growth portfolio whose bad years stay above the USD 70,000 line in 97–99% of simulated paths
