

Strategy: a five-ETF portfolio across Asia's AI-hardware chain

USD 100mn split across five Bloomberg-listed ETFs; half of it in the semiconductor core (3119 HK + 2644 JP)

ETF (Bloomberg)	Weight	USD mn	Role in the portfolio
3119 HK Global X Asia Semiconductor ETF	35%	35	Core: pan-Asian chip leaders (TSMC, Samsung, SK hynix)
EWY US iShares MSCI South Korea ETF	20%	20	Memory for AI: Samsung + SK hynix ≈ 44% of the fund
EWT US iShares MSCI Taiwan ETF	15%	15	The AI foundry: TSMC, MediaTek, Delta
2644 JP Global X Japan Semiconductor ETF	15%	15	Chip-making tools: Tokyo Electron, Advantest
00878 TT Cathay Taiwan ESG Sustainability High Dividend ETF	15%	15	ESG sleeve: dividend income, lowest volatility

Why these weights: the largest slice (35%) goes to the broadest chip basket; Korea (20%) adds memory, the tightest part of the AI supply chain; Taiwan, Japan and the ESG dividend sleeve (15% each) complete the chain and steady the ride.

One theme, five bottlenecks: chips, memory, foundry, tools, plus an ESG income anchor

Weights from the team's allocation. Liquidity rule (USD 5M/day, 6-month average): EWY, EWT, 2644 and 00878 pass; 3119 HK is borderline, verify on Bloomberg.

Monte Carlo: the median portfolio grows 2.8× in five years

5-year simulation of the five-ETF portfolio, per USD 100,000 invested (×1,000 for the USD 100mn mandate)

Source: team Monte Carlo app (annual checkpoints of the simulated paths). Lines connect the yearly values. Results depend on the app's return and volatility inputs; refresh with Bloomberg data at the 17 Sep 2026 trade date.

Annual checkpoints: the downside stays above the USD 70,000 target

Simulated portfolio value at each year-end, per USD 100,000 invested

Timeline	Median value (USD)	Bearish 5th percentile (USD)	Bullish 95th percentile (USD)	Probability ≥ target (USD 70,000)
Start	\$100,000.00	\$100,000.00	\$100,000.00	—
Year 1	\$122,798.06	\$77,939.19	\$189,886.46	97.72%
Year 2	\$150,858.02	\$79,780.84	\$286,013.81	97.46%
Year 3	\$186,215.83	\$83,307.87	\$406,264.32	97.76%
Year 4	\$228,430.07	\$92,823.04	\$564,512.06	98.28%
Year 5	\$279,609.52	\$103,554.03	\$770,498.81	99.00%

Year 1 is the stress point

The 5th percentile falls to \$77.9k (−22%) before recovering every year after.

The target holds

At least 97.5% of paths stay at or above USD 70,000 in every year, rising to 99.0% at Year 5.

Upside compounds

Median \$279.6k at Year 5 (+22.8% a year); for the mandate, about USD 280mn.

A growth portfolio whose bad years stay above the USD 70,000 line in 97–99% of simulated paths
